第十六章

2. 代入 Legendre 多项式的微分表示, 分部积分 l 次, 得:

$$\begin{aligned}\int_{-1}^1 (1+x)^k P_l(x) dx &= \frac{1}{2^l l!} \int_{-1}^1 \frac{d(1+x)^k}{dx} \frac{d^l(x^2-1)^l}{dx^l} dx \\ &= (-1)^l \frac{1}{2^l l!} \int_{-1}^1 \frac{d^l(1+x)^k}{dx^l} (x^2-1)^l dx \\ &= \frac{1}{2^l l!} \int_{-1}^1 \frac{d^l(1+x)^k}{dx^l} (1-x^2)^l dx\end{aligned}$$

分两种情况讨论:

$k < l$ 时, 应有:

$$\frac{d^l(1+x)^k}{dx^l} = 0$$

则:

$$\int_{-1}^1 (1+x)^k P_l(x) dx = 0$$

$k \geq l$ 时,

$$\begin{aligned}\frac{1}{2^l l!} \int_{-1}^1 \frac{d^l(1+x)^k}{dx^l} (1-x^2)^l dx &= \frac{1}{2^l l! (k-l)!} \int_{-1}^1 (1+x)^{k-l} (1-x^2)^l dx \\ &= \frac{1}{2^l l! (k-l)!} \int_{-1}^1 (1+x)^{k-l} (1+x)^l (1-x)^l dx \\ &= \frac{1}{2^l l! (k-l)!} \int_{-1}^1 (1+x)^k (1-x)^l dx\end{aligned}$$

再分部积分 l 次得:

$$\begin{aligned}\int_{-1}^1 (1+x)^k (1-x)^l dx &= \frac{1}{k+1} (1+x)^{k+1} (1-x)^l \Big|_{-1}^1 - \int_{-1}^1 \frac{1}{k+1} (1+x)^{k+1} [-l(1-x)^{l-1}] dx \\ &= \frac{1}{k+1} (1+x)^{k+1} (1-x)^l \Big|_{-1}^1 + \frac{l}{k+1} \int_{-1}^1 (1+x)^{k+1} (1-x)^{l-1} dx\end{aligned}$$

$$\begin{aligned}
&= \frac{l}{k+1} \int_{-1}^1 (1+x)^{k+1} (1-x)^{l-1} dx \\
&= \frac{l}{k+1} \cdot \frac{l-1}{k+2} \int_{-1}^1 (1+x)^{k+2} (1-x)^{l-2} dx \\
&= \frac{l!k!}{(k+l)!} \int_{-1}^1 (1+x)^{k+l} dx \\
&= \frac{l!k!}{(k+l)!} \cdot \frac{1}{k+l+1} (1+x)^{k+l+1} \Big|_{-1}^1 \\
&= \frac{l!k!}{(k+l+1)!} 2^{k+l+1}
\end{aligned}$$

则原积分：

$$\begin{aligned}
\int_{-1}^1 (1+x)^k P_l(x) dx &= \frac{1}{2^l l!} \int_{-1}^1 \frac{d^l (1+x)^k}{dx^l} (1-x^2)^l dx \\
&= \frac{1}{2^l} \frac{k!}{l!(k-l)!} \int_{-1}^1 (1+x)^k (1-x)^l dx \\
&= \frac{1}{2^l} \frac{k!}{l!(k-l)!} \int_{-1}^1 (1+x)^k (1-x)^l dx \\
&= \frac{1}{2^l} \frac{k!}{l!(k-l)!} \cdot \frac{l!k!}{(k+l+1)!} 2^{k+l+1} \\
&= \frac{(k!)^2}{(k-l)!(k+l+1)!} 2^{k+1}
\end{aligned}$$

综上：

$$\int_{-1}^1 (1+x)^k P_l(x) dx = \begin{cases} 0, & k < l \\ \frac{(k!)^2}{(k-l)!(k+l+1)!} 2^{k+1}, & k \geq l \end{cases}$$

3.(1) 分两种情况讨论：

$l=0$ 时， $P_0(x)=1$ ，直接积分：

$$\begin{aligned}
\int_{-1}^1 P_l(x) \ln(1-x) dx &= \int_{-1}^1 \ln(1-x) dx \\
&= (1-x) - (1-x) \ln(1-x) \Big|_{-1}^1 \\
&= 2 \ln 2 - 2
\end{aligned}$$

$l>0$ 时，代入 Legendre 方程，分部积分：

$$\begin{aligned}
\int_{-1}^1 P_l(x) \ln(1-x) dx &= \int_{-1}^1 \ln(1-x) \cdot \left(-\frac{1}{l(l+1)} \right) \frac{d}{dx} \left[(1-x^2) \frac{dP_l(x)}{dx} \right] dx \\
&= -\frac{1}{l(l+1)} \int_{-1}^1 \ln(1-x) \frac{d}{dx} \left[(1-x^2) \frac{dP_l(x)}{dx} \right] dx
\end{aligned}$$

$$\begin{aligned}
&= -\frac{1}{l(l+1)} \int_{-1}^1 \ln(1-x) \, d \left[(1-x^2) \frac{dP_l(x)}{dx} \right] \\
&= \frac{1}{l(l+1)} \int_{-1}^1 (1-x^2) \frac{dP_l(x)}{dx} d \ln(1-x)
\end{aligned}$$

其中利用了：

$$\begin{aligned}
\lim_{x \rightarrow 1} \frac{1-x}{\ln(1-x)} &= \lim_{x \rightarrow 1} \frac{-1}{-\frac{1}{1-x}} \\
&= \lim_{x \rightarrow 1} (1-x) \\
&= 0
\end{aligned}$$

则

$$\ln(1-x) \left[(1-x^2) \frac{dP_l(x)}{dx} \right] \Big|_{-1}^1 = 0$$

再次分部积分：

$$\begin{aligned}
\int_{-1}^1 P_l(x) \ln(1-x) \, dx &= \frac{1}{l(l+1)} \int_{-1}^1 (1-x^2) \frac{dP_l(x)}{dx} d \ln(1-x) \\
&= \frac{1}{l(l+1)} \int_{-1}^1 (1-x^2) \frac{dP_l(x)}{dx} \left(-\frac{1}{1-x} dx \right) \\
&= -\frac{1}{l(l+1)} \int_{-1}^1 (1+x) \frac{dP_l(x)}{dx} dx \\
&= -\frac{1}{l(l+1)} \int_{-1}^1 (1+x) dP_l(x) \\
&= -\frac{1}{l(l+1)} (1+x)P_l(x) \Big|_{-1}^1 + \frac{1}{l(l+1)} \int_{-1}^1 P_l(x) d(1+x) \\
&= -\frac{1}{l(l+1)} (1+x)P_l(x) \Big|_{-1}^1 + \frac{1}{l(l+1)} \int_{-1}^1 P_l(x) dx \\
&= -\frac{2}{l(l+1)}
\end{aligned}$$

其中利用了：

$$\begin{aligned}
P_l(1) &= 1, \quad P_l(-1) = (-1)^l \\
\int_{-1}^1 x^n P_l(x) \, dx &= 0, \quad n < l
\end{aligned}$$

综上：

$$\int_{-1}^1 P_l(x) \ln(1-x) \, dx = \begin{cases} 2 \ln 2 - 2, & l = 0 \\ -\frac{2}{l(l+1)}, & l > 0 \end{cases}$$

3.(3) 对于 Legendre 多项式 $P_k(x)$, k 为奇数时, $P_k(x)$ 为奇函数, k 为偶数时, $P_k(x)$ 为偶函数。

分两种情况讨论:

$k + l = 2a$ ($a \in \mathbb{N}$) 时, $P_k(x)P_l(x)$ 为偶函数, 直接积分:

$$\begin{aligned} \int_0^1 P_k(x)P_l(x) dx &= \frac{1}{2} \int_{-1}^1 P_k(x)P_l(x) dx \\ &= \frac{1}{2} \cdot \frac{2}{2l+1} \delta_{kl} \\ &= \frac{1}{2l+1} \delta_{kl} \end{aligned}$$

$k + l = 2a + 1$ ($a \in \mathbb{N}$) 时, $P_k(x)P_l(x)$ 为奇函数。由 Legendre 方程得:

$$\frac{d}{dx} \left[(1-x^2) \frac{dP_k(x)}{dx} \right] + k(k+1)P_k(x) = 0 \quad (1)$$

$$\frac{d}{dx} \left[(1-x^2) \frac{dP_l(x)}{dx} \right] + l(l+1)P_l(x) = 0 \quad (2)$$

(1) $\times P_l(x) - (2) \times P_k(x)$, 并整理得:

$$[k(k+1) - l(l+1)]P_k(x)P_l(x) = P_k(x) \frac{d}{dx} \left[(1-x^2) \frac{dP_l(x)}{dx} \right] - P_l(x) \frac{d}{dx} \left[(1-x^2) \frac{dP_k(x)}{dx} \right]$$

上式两边对 x 积分得:

$$\begin{aligned} &[k(k+1) - l(l+1)] \int_0^1 P_k(x)P_l(x) dx \\ &= \int_0^1 \left\{ P_k(x) \frac{d}{dx} \left[(1-x^2) \frac{dP_l(x)}{dx} \right] - P_l(x) \frac{d}{dx} \left[(1-x^2) \frac{dP_k(x)}{dx} \right] \right\} dx \\ &= (1-x^2) \left[P_k(x) \frac{dP_l(x)}{dx} - P_l(x) \frac{dP_k(x)}{dx} \right] \Big|_0^1 \\ &= P_l(0)P'_k(0) - P_k(0)P'_l(0) \end{aligned}$$

由 Legendre 多项式:

$$P_n(x) = \sum_{r=0}^{[n/2]} (-1)^r \frac{(2n-2r)!}{2^n r!(n-r)!(n-2r)!} x^{n-2r}$$

令 $n = 2m$, $r = m$ 得:

$$P_{2m}(0) = \frac{(-1)^m (2m)!}{(2^m m!)^2}, \quad m \in \mathbb{N}$$

$$P'_{2m}(0) = 0, \quad m \in \mathbb{N}$$

令 $n = 2m + 1$, $r = m$ 得:

$$P_{2m+1}(0) = 0, \quad m \in \mathbb{N}$$

$$P'_{2m+1}(0) = \frac{(-1)^m (2m+2)!}{2^{2m+1} m! (m+1)!}, \quad m \in \mathbb{N}$$

由于 $k + l = 2a + 1$ ($a \in \mathbb{N}$), 不妨设 $k = 2s$, $l = 2t + 1$, 则:

$$\begin{aligned}
 \int_0^1 P_k(x)P_l(x) dx &= \frac{P_l(0)P'_k(0) - P_k(0)P'_l(0)}{2s(2s+1) - (2t+1)(2t+2)} \\
 &= \frac{1}{2s(2s+1) - (2t+1)(2t+2)} \left[0 - \frac{(-1)^s(2s)!}{(2^s s!)^2} \cdot \frac{(-1)^t(2t+2)!}{2^{2t+1}t!(t+1)!} \right] \\
 &= \frac{1}{2s(2s+1) - (2t+1)(2t+2)} \cdot \frac{(-1)^{s+t+1}(2s)!(2t+2)!}{2^{2s+2t+1}(s!)^2 t!(t+1)!} \\
 &= \frac{-1}{2s(2s+1) - (2t+1)(2t+2)} \cdot \frac{(-1)^{s+t}(2s)!(2t+1)!(2t+2)}{2^{2s+2t}(s!t!)^2 \cdot 2(t+1)} \\
 &= \frac{(-1)^{s+t}}{(2t+1)(2t+2) - 2s(2s+1)} \cdot \frac{(2s)!(2t+1)!}{2^{2s+2t}(s!t!)^2}
 \end{aligned}$$

综上:

$$\int_0^1 P_k(x)P_l(x) dx = \begin{cases} \frac{(-1)^{s+t}\gamma_{kl}}{(2t+1)(2t+2) - 2s(2s+1)} \cdot \frac{(2s)!(2t+1)!}{2^{2s+2t}(s!t!)^2}, & k+l = 2a+1 \\ \frac{1}{2l+1}\delta_{kl}, & k+l = 2a \end{cases}$$

其中 $a, s, t \in \mathbb{N}$, $s = \left\lfloor \frac{k}{2} \right\rfloor$, $t = \left\lfloor \frac{l}{2} \right\rfloor$, 且

$$\gamma_{kl} = \begin{cases} 1, & k = 2s \\ -1, & k = 2s+1 \end{cases}$$

3.(5) 由 Legendre 多项式的递推关系:

$$(2l+1)xP_l(x) = (l+1)P_{l+1}(x) + lP_{l-1}(x)$$

得到:

$$\begin{aligned}
 xP_l(x) &= \frac{(l+1)P_{l+1}(x) + lP_{l-1}(x)}{2l+1} \\
 xP_{l+2}(x) &= \frac{(l+3)P_{l+3}(x) + (l+2)P_{l+1}(x)}{2l+5}
 \end{aligned}$$

代入积分式得:

$$\begin{aligned}
 \int_{-1}^1 x^2 P_l(x)P_{l+2}(x) dx &= \int_{-1}^1 \frac{(l+1)P_{l+1}(x) + lP_{l-1}(x)}{2l+1} \cdot \frac{(l+3)P_{l+3}(x) + (l+2)P_{l+1}(x)}{2l+5} dx \\
 &= \int_{-1}^1 \frac{l+1}{2l+1} \cdot \frac{l+2}{2l+5} P_{l+1}^2(x) dx \\
 &= \frac{l+1}{2l+1} \cdot \frac{l+2}{2l+5} \cdot \frac{2}{2l+3} \\
 &= \frac{2(l+1)(l+2)}{(2l+1)(2l+3)(2l+5)}
 \end{aligned}$$

4.(1) 由 Legendre 多项式:

$$P_n(x) = \sum_{r=0}^{[n/2]} (-1)^r \frac{(2n-2r)!}{2^n r! (n-r)! (n-2r)!} x^{n-2r}$$

可以得到: $P_n(x)$ 为 n 阶多项式; 且 n 为奇数时, P_n 为奇函数; n 为偶数时, P_n 为偶函数。

又因 $f(x) = x^2$ 为偶函数, 则其展开式应只含:

$$P_0(x) = 1, \quad P_2(x) = \frac{3}{2}x^2 - \frac{1}{2}$$

即:

$$f(x) = AP_0(x) + BP_2(x)$$

解得:

$$A = \frac{1}{3}, \quad B = \frac{2}{3}$$

故:

$$f(x) = x^2 = \frac{1}{3}P_0(x) + \frac{2}{3}P_2(x)$$

4.(3) 考虑函数 $f(x) = P_l(x)\eta(x)$ 的 Legendre 多项式展开:

$$f(x) = \sum_{k=0}^{\infty} c_k P_k(x)$$

其中:

$$\begin{aligned} c_k &= \frac{2k+1}{2} \int_{-1}^1 f(x) P_k(x) dx \\ &= \frac{2k+1}{2} \int_0^1 P_l(x) P_k(x) dx \end{aligned}$$

代入:

$$\int_0^1 P_k(x) P_l(x) dx = \begin{cases} \frac{(-1)^{s+t} \gamma_{kl}}{(2t+1)(2t+2) - 2s(2s+1)} \cdot \frac{(2s)!(2t+1)!}{2^{2s+2t} (s!t!)^2}, & k+l = 2a+1 \\ \frac{1}{2l+1} \delta_{kl}, & k+l = 2a \end{cases}$$

其中 $a, s, t \in \mathbb{N}$, $s = \left[\frac{k}{2} \right]$, $t = \left[\frac{l}{2} \right]$, 且

$$\gamma_{kl} = \begin{cases} 1, & k = 2s \\ -1, & k = 2s+1 \end{cases}$$

则:

$$f(x) = \frac{1}{2}P_l(x) + \sum_{k=0}^{\infty} \frac{2k+1}{2} \cdot \frac{(-1)^{s+t}\gamma_{kl}}{(2t+1)(2t+2)-2s(2s+1)} \cdot \frac{(2s)!(2t+1)!}{2^{2s+2t}(s!t!)^2} P_k(x)$$

令 $l=1$, 则 k 一定取偶数值, $t=0$, $\gamma_{kl}=1$, 上式化为:

$$\begin{aligned} f(x) &= x\eta(x) \\ &= \frac{x+|x|}{2} \\ &= \frac{1}{2}x + \sum_{s=0}^{\infty} \frac{4s+1}{2} \cdot \frac{(-1)^s}{2-2s(2s+1)} \cdot \frac{(2s)!}{2^{2s}(s!)^2} P_{2s}(x) \end{aligned}$$

得到:

$$|x| = \sum_{s=0}^{\infty} (4s+1) \cdot \frac{(-1)^s}{2-2s(2s+1)} \cdot \frac{(2s)!}{2^{2s}(s!)^2} P_{2s}(x)$$

整理得:

$$f(x) = |x| = \sum_{s=0}^{\infty} \frac{(-1)^{s-1}(2s)!}{(2^s s!)^2} \cdot \frac{(4s+1)}{4s^2+2s-2} P_{2s}(x)$$

5. 由题意, u 只与 r 、 θ 有关, 与 ϕ 无关, 设 $u = u(r, \theta)$ 。

设方程的解具有分离变量的形式:

$$u(r, \theta) = R(r)\Theta(\theta)$$

代入方程 $\nabla^2 u = 0$ 并分离变量得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - \lambda R = 0 \quad (1)$$

$$\frac{1}{\sin \theta} \cdot \frac{d}{d\theta} \left(\sin \theta \frac{d\Theta}{d\theta} \right) + \lambda \Theta = 0 \quad (2)$$

由 θ 的边界条件, 得:

$$\Theta(0) < \infty, \quad \Theta(\pi) < \infty \quad (3)$$

(2) 和 (3) 构成了 Legendre 本征值问题, 解为:

$$\lambda_l = l(l+1)$$

$$\Theta_l(\theta) = P_l(\cos \theta)$$

代入方程 (1) 得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - l(l+1)R = 0 \quad (4)$$

整理得:

$$r^2 \frac{d^2 R}{dr^2} + 2r \frac{dR}{dr} - l(l+1)R = 0$$

令 $t = \ln(r)$, 得:

$$\left(\frac{d^2 R}{dt^2} - \frac{dR}{dt}\right) + 2\frac{dR}{dt} - l(l+1)R = 0$$

特征方程为:

$$\rho^2 + \rho - l(l+1) = 0$$

解得:

$$\rho_1 = l, \quad \rho_2 = -l - 1$$

则:

$$R_l(r) = A_l r^l + B_l r^{-l-1}$$

定解问题的一般解为:

$$u(r, \theta) = \sum_{l=0}^{\infty} (A_l r^l + B_l r^{-l-1}) P_l(\cos \theta)$$

考虑边界条件:

$$u|_{r=a} = u_0, \quad u|_{r=b} = u_0 \cos^2 \theta = \frac{2}{3} u_0 P_2(\cos \theta) + \frac{1}{3} u_0 P_0(\cos \theta)$$

得方程:

$$\begin{cases} A_0 + B_0 a^{-1} = u_0 \\ A_2 a^2 + B_2 a^{-3} = 0 \\ A_0 + B_0 b^{-1} = \frac{1}{3} u_0 \\ A_2 b^2 + B_2 b^{-3} = \frac{2}{3} u_0 \end{cases}$$

解得:

$$\begin{cases} A_0 = \frac{b-3a}{3(b-a)} u_0 \\ A_2 = \frac{2b^3 a^2}{3a^2(b^5 - a^5)} u_0 \\ B_0 = \frac{2ab}{3(b-a)} u_0 \\ B_2 = \frac{2b^3 a^5}{3(b^5 - a^5)} u_0 \end{cases}$$

且其余系数均为 0。

综上, 定解问题的解为:

$$u(r, \theta) = \frac{b-3a}{3(b-a)} u_0 + \frac{2b}{3(b-a)} \cdot \frac{a}{r} u_0 + \frac{2b^3 a^2}{3(b^5 - a^5)} \left[\left(\frac{r}{a}\right)^2 - \left(\frac{a}{r}\right)^3 \right] u_0 P_2(\cos \theta)$$

7. 设半球内的温度分布为 $u = u(r, \theta, \phi)$, 则可得定解问题:

$$\nabla^2 u = 0, \quad 0 \leq \theta \leq \frac{\pi}{2}$$

$$u|_{r=0} < \infty, \quad u|_{r=a} = u_0 \operatorname{sgn}(\cos \theta)$$

由题意, u 只与 r 、 θ 有关, 与 ϕ 无关, 设 $u = u(r, \theta)$ 。

设方程的解具有分离变量的形式:

$$u(r, \theta) = R(r)\Theta(\theta)$$

代入方程 $\nabla^2 u = 0$ 并分离变量得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - \lambda R = 0 \quad (1)$$

$$\frac{1}{\sin \theta} \cdot \frac{d}{d\theta} \left(\sin \theta \frac{d\Theta}{d\theta} \right) + \lambda \Theta = 0 \quad (2)$$

由 θ 的边界条件, 得:

$$\Theta(0) < \infty, \quad \Theta\left(\frac{\pi}{2}\right) = 0 \quad (3)$$

(2) 和 (3) 构成了 Legendre 本征值问题, 其解为:

$$\lambda_l = l(l+1)$$

$$\Theta_l(\theta) = P_l(\cos \theta)$$

代入方程 (1) 得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - l(l+1)R = 0 \quad (4)$$

整理得:

$$r^2 \frac{d^2 R}{dr^2} + 2r \frac{dR}{dr} - l(l+1)R = 0$$

令 $t = \ln(r)$, 得:

$$\left(\frac{d^2 R}{dt^2} - \frac{dR}{dt} \right) + 2 \frac{dR}{dt} - l(l+1)R = 0$$

特征方程为:

$$\rho^2 + \rho - l(l+1) = 0$$

解得:

$$\rho_1 = l, \quad \rho_2 = -l-1$$

则:

$$R_l(r) = A_l r^l + B_l r^{-l-1}$$

定解问题的一般解为:

$$u(r, \theta) = \sum_{l=0}^{\infty} (A_l r^l + B_l r^{-l-1}) P_l(\cos \theta)$$

考虑边界条件:

$$u|_{r=0} < \infty, \quad u|_{r=a} = u_0 \operatorname{sgn}(\cos \theta)$$

由 $u|_{r=0} < \infty$ 得:

$$B_l = 0, \quad l \in \mathbb{N}$$

将边界条件按本征函数展开:

$$u_0 \operatorname{sgn}(\cos \theta) = \sum_{k=0}^{\infty} c_l P_l(x)$$

由于:

$$\operatorname{sgn}(\cos \theta) = 2\eta(\cos \theta) - 1$$

首先考虑将 $\eta(\cos \theta)$ 按 Legendre 多项式展开:

$$\eta(\cos \theta) = \sum_{k=0}^{\infty} m_l P_l(x)$$

当 $l \neq 0$ 时:

$$\begin{aligned} m_l &= \frac{2l+1}{2} \int_{-1}^1 \eta(\cos \theta) P_l(\cos \theta) d \cos \theta \\ &= \frac{2l+1}{2} \int_0^1 P_l(\cos \theta) d \cos \theta \end{aligned}$$

代入 Legendre 方程:

$$\frac{d}{d \cos \theta} \left[(1 - \cos^2 \theta) \frac{dP_l(\cos \theta)}{d \cos \theta} \right] + l(l+1)P_l(\cos \theta) = 0$$

即

$$P_l(\cos \theta) = \frac{-1}{l(l+1)} \cdot \frac{d}{d \cos \theta} \left[(1 - \cos^2 \theta) \frac{dP_l(\cos \theta)}{d \cos \theta} \right]$$

得:

$$\begin{aligned} m_l &= \frac{2l+1}{2} \int_0^1 P_l(\cos \theta) d \cos \theta \\ &= \frac{2l+1}{2} \cdot \frac{-1}{l(l+1)} \int_{-1}^1 \frac{d}{d \cos \theta} \left[(1 - \cos^2 \theta) \frac{dP_l(\cos \theta)}{d \cos \theta} \right] d \cos \theta \\ &= \frac{2l+1}{2} \cdot \frac{-1}{l(l+1)} \int_{-1}^1 d \left[(1 - \cos^2 \theta) \frac{dP_l(\cos \theta)}{d \cos \theta} \right] \\ &= -\frac{2l+1}{2l(l+1)} (1 - \cos^2 \theta) \frac{dP_l(\cos \theta)}{d \cos \theta} \Big|_0^1 \\ &= \frac{2l+1}{2l(l+1)} P'_l(0) \\ &= \begin{cases} 0, & l = 2k \\ \frac{4k+3}{2(2k+1)(2k+2)} \cdot \frac{(-1)^k (2k+2)!}{2^{2k+1} k! (k+1)!}, & l = 2k+1 \end{cases} \end{aligned}$$

当 $l \neq 0$ 时:

$$\int_0^1 P_0(\cos \theta) d \cos \theta = 1$$

则有:

$$\begin{aligned} \eta(\cos \theta) &= \frac{1}{2} + \frac{1}{2} \sum_{k=0}^{\infty} \frac{4k+3}{(2k+1)(2k+2)} \cdot \frac{(-1)^k (2k+2)!}{2^{2k+1} k! (k+1)!} P_{2k+1}(\cos \theta) \\ &= \frac{1}{2} + \frac{1}{2} \sum_{k=0}^{\infty} \frac{4k+3}{2k+2} \cdot \frac{(-1)^k (2k)!}{(2^k k!)^2} P_{2k+1}(\cos \theta) \end{aligned}$$

于是:

$$\begin{aligned} \operatorname{sgn}(\cos \theta) &= \sum_{k=0}^{\infty} \frac{4k+3}{2k+2} \cdot \frac{(-1)^k (2k)!}{(2^k k!)^2} P_{2k+1}(\cos \theta) \\ u|_{r=a} &= u_0 \operatorname{sgn}(\cos \theta) = u_0 \sum_{k=0}^{\infty} \frac{4k+3}{2k+2} \cdot \frac{(-1)^k (2k)!}{(2^k k!)^2} P_{2k+1}(\cos \theta) \end{aligned}$$

即:

$$\sum_{l=0}^{\infty} (A_l a^l) P_l(\cos \theta) = u_0 \sum_{k=0}^{\infty} \frac{4k+3}{2k+2} \cdot \frac{(-1)^k (2k)!}{(2^k k!)^2} P_{2k+1}(\cos \theta)$$

解得:

$$A_l = \begin{cases} 0, & l = 2k \\ \frac{u_0}{a^{2k+1}} \cdot \frac{4k+3}{2k+2} \cdot \frac{(-1)^k (2k)!}{(2^k k!)^2}, & l = 2k+1 \end{cases}$$

综上, 定解问题的解为:

$$u(r, \theta) = u_0 \sum_{k=0}^{\infty} \frac{4k+3}{2k+2} \cdot \frac{(-1)^k (2k)!}{(2^k k!)^2} \left(\frac{r}{a}\right)^{2k+1} P_{2k+1}(\cos \theta)$$

10.(2) 由于只出现 $\cos \phi$, 说明展开式中一定只含有 $m = \pm 1$ 的项, 相应地便需要将函数 $\sin \theta$ 与 $\cos \theta \sin \theta$ 设法化为 $P_l^1(\cos \theta)$ 的形式, 作变换 $x = \cos \theta$ 得:

$$\sin \theta = (1 - x^2)^{\frac{1}{2}}$$

$$\cos \theta \sin \theta = x(1 - x^2)^{\frac{1}{2}}$$

又因为:

$$\begin{aligned} P_1^1(x) &= \frac{(-1)^1}{2^1 1!} (1 - x^2)^{\frac{1}{2}} \frac{d}{dx} (x^2 - 1)^1 = -(1 - x^2)^{\frac{1}{2}} \\ P_2^1(x) &= \frac{(-1)^2}{2^2 2!} (1 - x^2)^{\frac{1}{2}} \frac{d^2}{dx^2} (x^2 - 1)^2 = -3x(1 - x^2)^{\frac{1}{2}} \end{aligned}$$

故:

$$\sin \theta = -P_1^1(\cos \theta)$$

$$\cos \theta \sin \theta = -\frac{1}{3}P_2^1(\cos \theta)$$

相应的球谐函数 $Y_l^m(\theta, \phi)$ 为:

$$Y_1^1(\theta, \phi) = \sqrt{\frac{3}{8\pi}}P_1^1(\cos \theta)e^{i\phi}$$

$$Y_2^1(\theta, \phi) = \sqrt{\frac{5}{24\pi}}P_2^1(\cos \theta)e^{i\phi}$$

则原函数按球谐函数 $Y_l^m(\theta, \phi)$ 的展开为:

$$\begin{aligned} (1 + \cos \theta) \sin \theta \cos \phi &= \sin \theta \cos \phi + \cos \theta \sin \theta \cos \phi \\ &= \frac{1}{2} \sin \theta (e^{i\phi} + e^{-i\phi}) + \frac{1}{2} \cos \theta \sin \theta (e^{i\phi} + e^{-i\phi}) \\ &= -\frac{1}{2} P_1^1(\cos \theta) (e^{i\phi} + e^{-i\phi}) - \frac{1}{2} \cdot \frac{1}{3} P_2^1(\cos \theta) (e^{i\phi} + e^{-i\phi}) \\ &= -\frac{1}{2} \sqrt{\frac{8\pi}{3}} [Y_1^1(\theta, \phi) + Y_1^{-1}(\theta, \phi)] - \frac{1}{6} \sqrt{\frac{24\pi}{5}} [Y_2^1(\theta, \phi) + Y_2^{-1}(\theta, \phi)] \\ &= -\sqrt{\frac{2\pi}{3}} [Y_1^1(\theta, \phi) + Y_1^{-1}(\theta, \phi)] - \sqrt{\frac{2\pi}{15}} [Y_2^1(\theta, \phi) + Y_2^{-1}(\theta, \phi)] \end{aligned}$$

11.(1) 设半球内的温度分布为 $u = u(r, \theta, \phi)$, 则可得定解问题:

$$\nabla^2 u = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial u}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial u}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 u}{\partial \phi^2} = 0$$

$$u|_{r=0} < \infty, \quad u|_{r=a} = P_1^1(\cos \theta) \cos \phi$$

$$u|_{\theta=0} < \infty, \quad u|_{\theta=\pi} < \infty$$

$$u|_{\phi=0} = u|_{\phi=2\pi}, \quad \left. \frac{\partial u}{\partial \phi} \right|_{\phi=0} = \left. \frac{\partial u}{\partial \phi} \right|_{\phi=2\pi}$$

设方程的解具有分离变量的形式:

$$u(r, \theta) = R(r)S(\theta, \phi)$$

代入方程 $\nabla^2 u = 0$ 并分离变量得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - \lambda R = 0 \quad (1)$$

$$\frac{1}{\sin \theta} \cdot \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial S(\theta, \phi)}{\partial \theta} \right) + \frac{1}{\sin^2 \theta} \cdot \frac{\partial^2 S(\theta, \phi)}{\partial \phi^2} + \lambda S(\theta, \phi) = 0 \quad (2)$$

由 θ 和 ϕ 的边界条件, 得:

$$S|_{\theta=0} < \infty, \quad S|_{\theta=\pi} < \infty \quad (3)$$

$$S|_{\phi=0} = S|_{\phi=2\pi}, \quad \left. \frac{\partial S}{\partial \phi} \right|_{\phi=0} = \left. \frac{\partial S}{\partial \phi} \right|_{\phi=2\pi} \quad (4)$$

(2)、(3) 和 (4) 构成了本征值问题，其解为：

$$\lambda_l = l(l+1)$$

$$S_l^m(\theta, \phi) = Y_l^m(\theta, \phi), \quad m = 0, \pm 1, \pm 2, \dots, \pm l$$

代入方程 (1) 得：

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - l(l+1)R = 0 \quad (5)$$

其解为：

$$R_l(r) = A_l^m r^l + B_l^m r^{-l-1}$$

定解问题的一般解为：

$$u(r, \theta) = \sum_{l=0}^{\infty} \sum_{m=-l}^l (A_l^m r^l + B_l^m r^{-l-1}) Y_l^m(\theta, \phi)$$

考虑边界条件：

$$u|_{r=0} < \infty, \quad u|_{r=a} = P_1^1(\cos \theta) \cos \phi$$

由 $u|_{r=0} < \infty$ 得：

$$B_l = 0, \quad l \in \mathbb{N}$$

将边界条件按球谐函数展开：

$$P_1^1(\cos \theta) \cos \phi = \sqrt{\frac{2\pi}{3}} [Y_1^1(\theta, \phi) + Y_1^{-1}(\theta, \phi)]$$

于是：

$$u|_{r=a} = P_1^1(\cos \theta) \cos \phi = \sqrt{\frac{2\pi}{3}} [Y_1^1(\theta, \phi) + Y_1^{-1}(\theta, \phi)]$$

即：

$$\sum_{l=0}^{\infty} \sum_{m=-l}^l A_l^m a^l Y_l^m(\theta, \phi) = \sqrt{\frac{2\pi}{3}} [Y_1^1(\theta, \phi) + Y_1^{-1}(\theta, \phi)]$$

解得：

$$A_1^1 = A_1^{-1} = \frac{1}{a} \sqrt{\frac{2\pi}{3}}$$

其余系数均为 0。

综上，定解问题的解为：

$$\begin{aligned} u(r, \theta) &= \frac{r}{a} \sqrt{\frac{2\pi}{3}} [Y_1^1(\theta, \phi) + Y_1^{-1}(\theta, \phi)] \\ &= \frac{r}{a} P_1^1(\cos \theta) \cos \phi \\ &= -\frac{r}{a} \sin \theta \cos \phi \end{aligned}$$

11.(2) 设半球内的温度分布为 $u = u(r, \theta, \phi)$, 则可得定解问题:

$$\nabla^2 u = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial u}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial u}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 u}{\partial \phi^2} = 0$$

$$u|_{r=0} < \infty, \quad u|_{r=a} = P_1(\cos \theta) \sin \theta \cos \phi$$

$$u|_{\theta=0} < \infty, \quad u|_{\theta=\pi} < \infty$$

$$u|_{\phi=0} = u|_{\phi=2\pi}, \quad \left. \frac{\partial u}{\partial \phi} \right|_{\phi=0} = \left. \frac{\partial u}{\partial \phi} \right|_{\phi=2\pi}$$

设方程的解具有分离变量的形式:

$$u(r, \theta) = R(r)S(\theta, \phi)$$

代入方程 $\nabla^2 u = 0$ 并分离变量得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - \lambda R = 0 \quad (1)$$

$$\frac{1}{\sin \theta} \cdot \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial S(\theta, \phi)}{\partial \theta} \right) + \frac{1}{\sin^2 \theta} \cdot \frac{\partial^2 S(\theta, \phi)}{\partial \phi^2} + \lambda S(\theta, \phi) = 0 \quad (2)$$

由 θ 和 ϕ 的边界条件, 得:

$$S|_{\theta=0} < \infty, \quad S|_{\theta=\pi} < \infty \quad (3)$$

$$S|_{\phi=0} = S|_{\phi=2\pi}, \quad \left. \frac{\partial S}{\partial \phi} \right|_{\phi=0} = \left. \frac{\partial S}{\partial \phi} \right|_{\phi=2\pi} \quad (4)$$

(2)、(3) 和 (4) 构成了本征值问题, 其解为:

$$\lambda_l = l(l+1)$$

$$S_l^m(\theta, \phi) = Y_l^m(\theta, \phi), \quad m = 0, \pm 1, \pm 2, \dots, \pm l$$

代入方程 (1) 得:

$$\frac{d}{dr} \left(r^2 \frac{dR}{dr} \right) - l(l+1)R = 0 \quad (5)$$

其解为:

$$R_l(r) = A_l^m r^l + B_l^m r^{-l-1}$$

定解问题的一般解为:

$$u(r, \theta) = \sum_{l=0}^{\infty} \sum_{m=-l}^l (A_l^m r^l + B_l^m r^{-l-1}) Y_l^m(\theta, \phi)$$

考虑边界条件:

$$u|_{r=0} < \infty, \quad u|_{r=a} = P_1(\cos \theta) \sin \theta \cos \phi$$

由 $u|_{r=0} < \infty$ 得:

$$B_l = 0, \quad l \in \mathbb{N}$$

将边界条件按球谐函数展开:

$$P_1(\cos \theta) \sin \theta \cos \phi = \cos \theta \sin \theta \cos \phi = -\sqrt{\frac{2\pi}{15}} [Y_2^1(\theta, \phi) + Y_2^{-1}(\theta, \phi)]$$

于是:

$$u|_{r=a} = P_1(\cos \theta) \sin \theta \cos \phi = -\sqrt{\frac{2\pi}{15}} [Y_2^1(\theta, \phi) + Y_2^{-1}(\theta, \phi)]$$

即:

$$\sum_{l=0}^{\infty} \sum_{m=-l}^l A_l^m a^l Y_l^m(\theta, \phi) = -\sqrt{\frac{2\pi}{15}} [Y_2^1(\theta, \phi) + Y_2^{-1}(\theta, \phi)]$$

解得:

$$A_2^1 = A_2^{-1} = -\frac{1}{a} \sqrt{\frac{2\pi}{15}}$$

其余系数均为 0。

综上, 定解问题的解为:

$$\begin{aligned} u(r, \theta) &= -\left(\frac{r}{a}\right)^2 \sqrt{\frac{2\pi}{15}} [Y_2^1(\theta, \phi) + Y_2^{-1}(\theta, \phi)] \\ &= -\frac{1}{3} \left(\frac{r}{a}\right)^2 P_2^1(\cos \theta) \cos \phi \\ &= \left(\frac{r}{a}\right)^2 \cos \theta \sin \theta \cos \phi \end{aligned}$$

12. 设球内问题的解可以写为如下形式:

$$u(r, \theta, \phi) = v(r, \theta, \phi) + w(r, \theta, \phi)$$

其中:

$$\nabla^2 v = A$$

$$u|_{r=0} < \infty, \quad u|_{r=a} = 0$$

且

$$\nabla^2 w = Br^2 \sin 2\theta \cos \phi$$

$$w|_{r=0} < \infty, \quad w|_{r=a} = 0$$

下面考虑这样的定解问题:

$$\nabla^2 U = Kr^n P_l^m(\cos \theta) \cos m\phi$$

$$U|_{r=0} < \infty, \quad U|_{r=a} = 0$$

$$U|_{\theta=0} < \infty, \quad U|_{\theta=\pi} < \infty$$

$$U|_{\phi=0} = U|_{\phi=2\pi}, \quad \left. \frac{\partial U}{\partial \phi} \right|_{\phi=0} = \left. \frac{\partial U}{\partial \phi} \right|_{\phi=2\pi}$$

考虑到 θ 和 ϕ 的边界条件, 设方程的解有如下形式:

$$U(r, \theta, \phi) = \sum_{k=0}^{\infty} \sum_{s=0}^k [M_k^s(r) \sin s\phi + N_k^s(r) \cos s\phi] P_s^k(\cos \theta)$$

代入 U 所满足的方程及 r 的边界条件, 并利用本征函数的正交性, 即可推得 $M_k^s(r)$ 和 $N_k^s(r)$ 满足的定解问题:

$$\frac{d}{dr} \left(r^2 \frac{dM_k^s}{dr} \right) - k(k+1)M_k^s = 0 \quad (1)$$

$$M_k^s|_{r=0} < \infty, \quad M_k^s|_{r=a} = 0 \quad (2)$$

以及

$$\frac{d}{dr} \left(r^2 \frac{dN_k^s}{dr} \right) - k(k+1)N_k^s = Ar^{n+2}\delta_{kl}\delta_{sm} \quad (3)$$

$$N_k^s|_{r=0} < \infty, \quad N_k^s|_{r=a} = 0 \quad (4)$$

方程 (1) 的通解为:

$$M_k^s(r) = Cr^k + Dr^{-k-1}$$

代入边界条件 (2) 后, 可以得到:

$$C = D = 0$$

即:

$$M_k^s(r) = 0$$

显然, 对于方程 (3) 和边界条件 (4), 当 $k \neq l$ 、 $s \neq m$ 时, 定解问题退化为 (1) 和 (2); 当 $k = l$ 、 $s = m$ 时, 方程才有非零解。

分两种情况讨论:

$n \neq l - 2$ 时, 方程 (3) 的解不含对数项:

$$N_k^s = \frac{K}{(n+2)(n+3) - l(l+1)} r^{n+2} + Er^l + Fr^{-l-1}$$

代入边界条件 (4), 可得:

$$E = -\frac{K}{(n+2)(n+3) - l(l+1)} a^{n-l+2}, \quad F = 0$$

$$N_k^s = \frac{K}{(n+2)(n+3) - l(l+1)} (r^{n+2} - a^{n-l+2}r^l)$$

$n = l - 2$ 时, 方程 (3) 的解必含对数项:

$$N_k^s = \frac{K}{2l+1} r^l \ln r + G$$

代入边界条件 (4), 可得:

$$G = -\frac{K}{2l+1} r^l \ln a$$

$$N_k^s = \frac{K}{2l+1} r^l (\ln r - \ln a)$$

故关于 U 的定解问题的解为:

$$U(r, \theta, \phi) = \begin{cases} \frac{K}{(n+2)(n+3) - l(l+1)} (r^{n+2} - a^{n-l+2}r^l) P_l^m(\cos \theta) \cos m\phi, & n \neq l - 2 \\ \frac{K}{2l+1} r^l (\ln r - \ln a) P_l^m(\cos \theta) \cos m\phi, & n = l - 2 \end{cases}$$

对于 $v(r, \theta, \phi)$, $K = A$, $n = m = l = 0$, 且 $n \neq l - 2$, 定解问题的解为:

$$v(r, \theta, \phi) = \frac{A}{6}(r^2 - a^2)$$

对于 $w(r, \theta, \phi)$, 注意到:

$$\begin{aligned}\nabla^2 w &= Br^2 \sin 2\theta \cos \phi \\ &= 2Br^2 \cos \theta \sin \theta \cos \phi \\ &= -\frac{2}{3}Br^2 P_2^1(\cos \theta) \cos \phi\end{aligned}$$

则 $K = -\frac{2}{3}B$, $n = l = 2$, $m = 1$, 且 $n \neq l - 2$, 定解问题的解为:

$$w(r, \theta, \phi) = -\frac{B}{21}r^2(r^2 - a^2)P_2^1(\cos \theta) \cos \phi$$

综上, 原球内问题的解为:

$$\begin{aligned}u(r, \theta, \phi) &= v(r, \theta, \phi) + w(r, \theta, \phi) \\ &= \frac{A}{6}(r^2 - a^2) - \frac{B}{21}r^2(r^2 - a^2)P_2^1(\cos \theta) \cos \phi \\ &= \frac{A}{6}(r^2 - a^2) + \frac{B}{14}r^2(r^2 - a^2) \sin 2\theta \cos \phi\end{aligned}$$
