第七章

1. 运动电子在 $\mathbf{n}$ 方向辐射场的功率为:

$$\frac{dP}{d\Omega} = \frac{e^2}{16\pi^2\epsilon_0 c^3} \frac{\|\mathbf{n} \times [(\mathbf{n} - \boldsymbol{\beta}) \times \dot{\boldsymbol{\beta}}]\|^2}{(1 - \mathbf{n} \cdot \boldsymbol{\beta})^5}$$

则当 $(\mathbf{n} - \boldsymbol{\beta}) \times \dot{\boldsymbol{\beta}} = 0$ 时, $\mathbf{n}$ 方向无辐射, 即:

$$\mathbf{n} \times \dot{\boldsymbol{\beta}} = \boldsymbol{\beta} \times \dot{\boldsymbol{\beta}}$$

又因为: (其中 α 为 $\boldsymbol{\beta}$ 与 $\dot{\boldsymbol{\beta}}$ 的夹角, $\dot{\beta} = \|\dot{\boldsymbol{\beta}}\|$)

$$\|\mathbf{n} \times \dot{\boldsymbol{\beta}}\| = \dot{\beta} \sin \theta, \quad \|\boldsymbol{\beta} \times \dot{\boldsymbol{\beta}}\| = \beta \dot{\beta} \sin \alpha$$

所以当 $\sin \theta = \beta \sin \alpha = \frac{v}{c} \sin \alpha$ 时, $\mathbf{n}$ 方向无辐射。

3.(1) 由于 $z_0 \omega \ll c$, 即带电粒子的速度远小于光速, 辐射场可近似写为:

$$\mathbf{E} = \frac{q}{4\pi\epsilon_0 c^2} \frac{\hat{\mathbf{r}} \times (\hat{\mathbf{r}} \times \dot{\mathbf{v}})}{r}, \quad \mathbf{B} = \frac{1}{c} \mathbf{r} \times \mathbf{E}$$

由于粒子在 t' 时刻从源点辐射的电磁波, 在 $t = t' + \frac{r}{c}$ 时刻才传播到场点, 则有:

$$\mathbf{z} = z_0 \mathbf{e}^{-i\omega t'} = z_0 \mathbf{e}^{ikr - i\omega t}, \quad k = \frac{\omega}{c}$$

粒子的速度和加速度为:

$$\mathbf{v} = -i\omega z_0 \mathbf{e}^{ikr - i\omega t} \hat{\mathbf{z}}, \quad \dot{\mathbf{v}} = -\omega^2 z_0 \mathbf{e}^{ikr - i\omega t} \hat{\mathbf{z}}$$

设 θ 为辐射方向 $\hat{\mathbf{r}}$ 与 $\hat{\mathbf{z}}$ 的夹角, 由 $\hat{\mathbf{z}} = \hat{\mathbf{r}} \cos \theta - \hat{\boldsymbol{\theta}} \sin \theta$ 得:

$$\hat{\mathbf{z}} \times \hat{\mathbf{r}} = \hat{\boldsymbol{\phi}} \sin \theta, \quad \hat{\mathbf{r}} \times (\hat{\mathbf{r}} \times \hat{\mathbf{z}}) = \hat{\boldsymbol{\theta}} \sin \theta$$

故产生的辐射场为电偶极辐射:

$$\begin{aligned} \mathbf{E} &= \frac{q}{4\pi\epsilon_0 c^2} \frac{\hat{\mathbf{r}} \times (\hat{\mathbf{r}} \times \dot{\mathbf{v}})}{r} = -\frac{q\omega^2 z_0}{4\pi\epsilon_0 c^2} \hat{\boldsymbol{\theta}} \sin \theta \frac{\mathbf{e}^{ikr - i\omega t}}{r} \\ \mathbf{B} &= \frac{1}{c} \mathbf{r} \times \mathbf{E} = -\frac{q\omega^2 z_0}{4\pi\epsilon_0 c^3} \hat{\boldsymbol{\phi}} \sin \theta \frac{\mathbf{e}^{ikr - i\omega t}}{r} \end{aligned}$$

辐射场的能流密度为:

$$\mathbf{S} = \frac{1}{2\mu_0} \mathbf{E} \times \mathbf{B}^* = \frac{q^2 \omega^4 z_0^2}{32\pi\epsilon_0 c^3} \frac{\sin^2 \theta}{r^2} \hat{\mathbf{r}}$$

3.(2) 设地面参考系为 Σ ，带电粒子的静止参考系为 Σ' 。

带电粒子的自场与加速度无关，在 Σ' 系中，粒子的自场为：

$$\mathbf{E}' = \frac{q}{4\pi\epsilon_0} \frac{\hat{\mathbf{r}}'}{r'^2}, \quad \mathbf{B}' = 0$$

由于 $z_0\omega \ll c$ ，即带电粒子的速度远小于光速，参考系 Σ' 与 Σ 之间的电磁场变换近似为：

$$\mathbf{E} = \mathbf{E}' - \mathbf{v} \times \mathbf{B}', \quad \mathbf{B} = \mathbf{B}' + \frac{1}{c^2} \mathbf{v} \times \mathbf{E}'$$

则在 Σ 系中，粒子的自场为：

$$\mathbf{E} = \frac{q}{4\pi\epsilon_0} \frac{\hat{\mathbf{r}}}{r^2}, \quad \mathbf{B} = \frac{q}{4\pi\epsilon_0 c^2} \frac{\mathbf{v} \times \hat{\mathbf{r}}}{r^2} = -\frac{iq\omega z_0}{4\pi\epsilon_0 c^2} \hat{\phi} \sin\theta \frac{e^{ikr-i\omega t}}{r^2}$$

可见辐射场与 $\frac{1}{r}$ 成正比，且与加速度 $\dot{\mathbf{v}}$ 有关；而自场与 $\frac{1}{r^2}$ 成正比，至多与速度 $\mathbf{v}$ 有关。

4. 做圆周运动的粒子的坐标为：

$$\mathbf{x} = R_0(\hat{x} \cos \omega t + \hat{y} \sin \omega t)$$

辐射场为电偶极辐射。

由于 $\text{Re}[(\hat{x} + i\hat{y})e^{-i\omega t}] = \hat{x} \cos \omega t + \hat{y} \sin \omega t$ ，故 $\mathbf{p}$ 也可以用复数表示为：

$$\mathbf{x} = R_0(\hat{x} + i\hat{y})e^{-i\omega t}$$

又使用直角坐标和球坐标的转换矩阵得到：

$$\mathbf{x} = R_0(\hat{r} \sin \theta + \theta \cos \theta + i\hat{\phi})e^{i\phi-i\omega t}$$

则有：

$$\ddot{\mathbf{x}} = (-i\omega)^2 \mathbf{x} = -\omega^2 R_0(\hat{r} \sin \theta + \theta \cos \theta + i\hat{\phi})e^{i\phi-i\omega t}$$

由于 $z_0\omega \ll c$ ，即带电粒子的速度远小于光速，辐射场可近似为电偶极辐射：

$$\mathbf{E} = \frac{q}{4\pi\epsilon_0 c^2} \frac{\hat{r} \times (\hat{r} \times \dot{\mathbf{x}})}{r} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^2} (\hat{\theta} \cos \theta + i\hat{\phi}) \frac{e^{i\phi-i\omega t+ikr}}{r}$$

$$\mathbf{B} = \frac{1}{c} \mathbf{r} \times \mathbf{E} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^3} (\hat{\phi} \cos \theta - i\hat{\theta}) \frac{e^{i\phi-i\omega t+ikr}}{r}$$

辐射场的能流密度为：

$$\mathbf{S} = \frac{1}{2\mu_0} \mathbf{E} \times \mathbf{B}^* = \frac{q^2 \omega^4 R_0^2}{32\pi^2 \epsilon_0 c^3} (1 + \cos^2 \theta) \frac{\hat{r}}{r^2}$$

讨论电磁场偏振如下：

• $\theta = 0$ 处：

$$\mathbf{E} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^2} (\hat{\theta} + i\hat{\phi}) \frac{e^{i\phi-i\omega t+ikr}}{r}$$

由于 $\text{Re}[(\hat{\theta} + i\hat{\phi})e^{-i\omega t}] = \hat{\theta} \cos \omega t + \hat{\phi} \sin \omega t$ ，即 $\hat{\theta}$ 和 $\hat{\phi}$ 两个方向上振幅相等，但 $\hat{\theta}$ 方向的振动比 $\hat{\phi}$ 方向超前 $\frac{\pi}{2}$ ，故在面向波传播方向的观察者看来， $\mathbf{E}$ 是左旋的圆偏振波；

- $\theta = \frac{\pi}{4}$ 处:

$$\mathbf{E} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^2} \left(\frac{\sqrt{2}}{2} \hat{\theta} + i\hat{\phi} \right) \frac{e^{i\phi - i\omega t + ikr}}{r}$$

在面对波传播方向的观察者看来, $\mathbf{E}$ 是左旋的椭圆偏振波;

- $\theta = \frac{\pi}{2}$ 处:

$$\mathbf{E} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^2} i\hat{\phi} \frac{e^{i\phi - i\omega t + ikr}}{r}$$

在面对波传播方向的观察者看来, $\mathbf{E}$ 是沿 $\hat{\phi}$ 振动的线偏振波;

- $\theta = \frac{3\pi}{4}$ 处:

$$\mathbf{E} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^2} \left(-\frac{\sqrt{2}}{2} \hat{\theta} + i\hat{\phi} \right) \frac{e^{i\phi - i\omega t + ikr}}{r}$$

在面对波传播方向的观察者看来, $\mathbf{E}$ 是右旋的椭圆偏振波;

- $\theta = \pi$ 处:

$$\mathbf{E} = \frac{q\omega^2 R_0}{4\pi\epsilon_0 c^2} (-\hat{\theta} + i\hat{\phi}) \frac{e^{i\phi - i\omega t + ikr}}{r}$$

在面对波传播方向的观察者看来, $\mathbf{E}$ 是右旋的圆偏振波。

5.(1) 设磁场方向为 $\hat{z}$ 方向, 即 $\mathbf{B} = B\hat{z}$, 则谐振子的运动方程为:

$$m\ddot{\mathbf{r}} = -m\omega_0^2 \mathbf{r} + q\dot{\mathbf{r}} \times \mathbf{B}$$

在直角坐标系 (x, y, z) 中写为:

$$m(\ddot{x}\hat{x} + \ddot{y}\hat{y} + \ddot{z}\hat{z}) = -m\omega_0^2(x\hat{x} + y\hat{y} + z\hat{z}) + qB(\dot{y}\hat{x} - \dot{x}\hat{y})$$

即:

$$\ddot{x} = -\omega_0^2 x + \frac{qB}{m} \dot{y} \quad (1)$$

$$\ddot{y} = -\omega_0^2 y - \frac{qB}{m} \dot{x} \quad (2)$$

$$\ddot{z} = -\omega_0^2 z \quad (3)$$

考虑将 $\hat{r}$ 进行如下分解:

$$\hat{r} = (x - iy)(\hat{x} + i\hat{y}) + z\hat{z}$$

则由 (1) 式和 (2) 式得:

$$\ddot{x} - i\ddot{y} = -\omega_0^2(x - iy) + \frac{qB}{m}(i\dot{x} + \dot{y})$$

记 $u = x - iy$, 则有:

$$\ddot{u} - i\frac{qB}{m}\dot{u} + \omega_0^2 u = 0$$

解得 $u(t)$ 的通解为:

$$u = C_1 e^{i\omega_1 t} + C_2 e^{i\omega_2 t}$$

其中：

$$\omega_1 = \frac{qB}{2m} + \sqrt{\left(\frac{qB}{2m}\right)^2 + \omega_0^2}, \quad \omega_2 = \frac{qB}{2m} - \sqrt{\left(\frac{qB}{2m}\right)^2 + \omega_0^2}$$

记 $\omega_L = \frac{qB}{2m}$ ，在 $\omega_L \ll \omega_0$ 的情况下（磁场对谐振子运动为微扰）：

$$\omega_1 \approx \omega_L + \omega_0, \quad \omega_2 \approx \omega_L - \omega_0$$

又由 (3) 式解得：

$$z = C_3 e^{i\omega_0 t}$$

谐振子运动的通解可以写为：

$$\mathbf{r} = C_1(\hat{x} + i\hat{y})e^{-i(\omega_0 - \omega_L)t} + C_2(\hat{x} + i\hat{y})e^{i(\omega_L + \omega_0)t} + C_3 e^{i\omega_0 t}$$

由于 $\text{Re}[(\hat{x} + i\hat{y})e^{-i\omega t}] = \hat{x} \cos \omega t - \hat{y} \sin \omega t$ ，故通解也可以写为：

$$\mathbf{r} = [C_1 \cos(\omega_0 - \omega_L)t + C_2 \cos(\omega_0 + \omega_L)t] \hat{x} - [C_1 \sin(\omega_0 - \omega_L)t + C_2 \sin(\omega_0 + \omega_L)t] \hat{y} + (C_3 \cos \omega_0 t) \hat{z}$$

5.(2) 辐射场的频率和偏振讨论如下：

- 沿磁场方向：两个频率分别为 $\omega_0 - \omega_L$ 、 $\omega_0 + \omega_L$ ，旋转方向相反的圆偏振光；
- 垂直于磁场方向：三个频率分别为 ω_0 、 $\omega_0 - \omega_L$ 、 $\omega_0 + \omega_L$ 的线偏振光。

6.(1) 电子受到磁场力和辐射阻尼力，其运动方程为：

$$m\ddot{\mathbf{r}} = e\dot{\mathbf{r}} \times \mathbf{B} + \frac{e^2}{6\pi\epsilon_0 c^3} \ddot{\mathbf{r}}$$

记 $\omega_0 = \frac{eB}{m}$ ， $\lambda = \frac{e^2 \omega_0^2}{6\pi\epsilon_0 m c^3}$ ，上式在直角坐标系 (x, y, z) 中写为：

$$\ddot{x}\hat{x} + \ddot{y}\hat{y} + \ddot{z}\hat{z} = \omega_0(\dot{y}\hat{x} - \dot{x}\hat{y}) + \frac{\lambda}{\omega_0^2}(\ddot{x}\hat{x} + \ddot{y}\hat{y} + \ddot{z}\hat{z})$$

即：

$$\ddot{x} = \omega_0 \dot{y} + \frac{\lambda}{\omega_0^2} \ddot{x} \quad (1)$$

$$\ddot{y} = -\omega_0 \dot{x} + \frac{\lambda}{\omega_0^2} \ddot{y} \quad (2)$$

$$\ddot{z} = \frac{\lambda}{\omega_0^2} \ddot{z} \quad (3)$$

考虑将 $\hat{r}$ 进行如下分解：

$$\hat{r} = (x - iy)(\hat{x} + i\hat{y}) + z\hat{z}$$

则由 (1) 式和 (2) 式得：

$$\ddot{x} - i\ddot{y} = -\omega_0^2(x - iy) + \frac{qB}{m}(i\dot{x} + \dot{y})$$

记 $u = x - iy$ ，则有：

$$\ddot{u} - i\omega_0 \dot{u} = \frac{\lambda}{\omega_0^2} \ddot{u} \quad (4)$$

由于:

$$\frac{\lambda}{\omega_0^2} = \frac{e^2}{6\pi\epsilon_0 mc^3} = 6.2664 \times 10^{-24} \ll 1$$

可以将 (4) 式等号右边的 $\frac{\lambda}{\omega^2}\ddot{u}$ 看作微扰项略去, 得到:

$$\ddot{u} - i\omega_0\dot{u} = 0$$

解得 $u(t)$ 的通解为:

$$u = C_1 e^{i\omega_0 t}$$

由此得 $\ddot{u} = -\omega_0^2 u$, 代入方程 (4) 得:

$$\ddot{u} - (i\omega_0 - \lambda)\dot{u} = 0$$

解得 $u(t)$ 的通解为:

$$u = C_1 e^{(i\omega_0 - \lambda)t} + C_2 = \left(C_1 e^{-\lambda t} \cos \omega_0 t + C_2 \right) + i \left(C_1 e^{-\lambda t} \sin \omega_0 t \right)$$

由于 $u = x - iy$, $\omega_0 \ll \lambda$, 且 $t = 0$ 时的初始条件为:

$$x = R_0, \quad y = 0, \quad \dot{x} = 0, \quad \dot{y} = v_0$$

得 x 和 y 坐标的运动轨迹:

$$x = v_0 \omega_0 e^{-\lambda t} \cos \omega_0 t + (R_0 - v_0 \omega_0) \quad (5)$$

$$y = v_0 \omega_0 e^{-\lambda t} \sin \omega_0 t \quad (6)$$

又由 (3) 式解得:

$$z = C_1 e^{\frac{\omega_0^2}{\lambda} t} + C_2 x + C_3$$

而 $t = 0$ 时的初始条件为:

$$z = 0, \quad \dot{z} = 0$$

则 z 坐标的运动轨迹为:

$$z = 0 \quad (7)$$

综合 (5)、(6)、(7) 三式可得: 电子运动轨迹是一条 Oxy 平面上的螺旋线。

6.(2) 由 (5)、(6)、(7) 三式可得电子的加速度分量:

$$\ddot{x} = v_0 \omega_0 \left[(\lambda^2 - 1) e^{-\lambda t} \cos \omega_0 t + 2\lambda e^{-\lambda t} \sin \omega_0 t \right] \quad (8)$$

$$\ddot{y} = v_0 \omega_0 \left[(\lambda^2 - 1) e^{-\lambda t} \sin \omega_0 t - 2\lambda e^{-\lambda t} \cos \omega_0 t \right] \quad (9)$$

$$\ddot{z} = 0 \quad (10)$$

由于 $\lambda \ll \omega_0$, 可将 λ 项和 λ^2 项均略去, 得到:

$$\ddot{x} = -v_0 \omega_0 e^{-\lambda t} \cos \omega_0 t, \quad \ddot{y} = -v_0 \omega_0 e^{-\lambda t} \sin \omega_0 t, \quad \ddot{z} = 0$$

则电子的加速度大小为:

$$\dot{v} = \sqrt{\ddot{x}^2 + \ddot{y}^2 + \ddot{z}^2} = v_0^2 \omega_0^2 e^{-2\lambda t}$$

在非相对论条件下, 由 Larmor 公式得电子单位时间的辐射能量 (辐射功率) 为:

$$P = \frac{e^2 \dot{v}^2}{6\pi\epsilon_0 c^3} = \frac{e^2 v_0^2 \omega_0^2}{6\pi\epsilon_0 c^3} e^{-2\lambda t}$$

7.(1) 由 $\gamma = \frac{1}{\sqrt{1 - \boldsymbol{\beta} \cdot \boldsymbol{\beta}}}$ 得:

$$\frac{d\gamma}{dt} = \frac{d\gamma}{d\boldsymbol{\beta}} \cdot \frac{d\boldsymbol{\beta}}{dt} = (\boldsymbol{\beta}\gamma^3) \cdot \dot{\boldsymbol{\beta}} = (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}})\gamma^3$$

利用乘积的求导法则可得: (其中 ret 表示时刻 $t' = t - \frac{r}{c}$ 时的值)

$$\mathbf{F} = \frac{d}{dt}(\gamma m \mathbf{v}) = \frac{d}{dt}(\gamma m c \boldsymbol{\beta}) = \gamma m c [\dot{\boldsymbol{\beta}} + \gamma^2 (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}}) \boldsymbol{\beta}]_{\text{ret}}$$

于是有: (注意 $1 + \gamma^2 \boldsymbol{\beta}^2 = 1 + \frac{\beta^2}{1 - \beta^2} = \frac{1}{1 - \beta^2} = \gamma^2$ 以及 $\boldsymbol{\beta} \times \boldsymbol{\beta} = 0$)

$$\boldsymbol{\beta} \cdot \mathbf{F} = \gamma m c \boldsymbol{\beta} \cdot [\dot{\boldsymbol{\beta}} + \gamma^2 (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}}) \boldsymbol{\beta}] = \gamma m c (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}}) (1 + \gamma^2 \boldsymbol{\beta}^2) = \gamma^3 m c (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}})$$

$$\boldsymbol{\beta} \times \mathbf{F} = \gamma m c \boldsymbol{\beta} \times [\dot{\boldsymbol{\beta}} + \gamma^2 (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}}) \boldsymbol{\beta}] = \gamma m c (\boldsymbol{\beta} \times \dot{\boldsymbol{\beta}})$$

$$\hat{\mathbf{r}} \times \mathbf{F} = \gamma m c \hat{\mathbf{r}} \times [\dot{\boldsymbol{\beta}} + \gamma^2 (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}}) \boldsymbol{\beta}] = \gamma m c (\hat{\mathbf{r}} \times \dot{\boldsymbol{\beta}}) + \gamma^3 m c (\boldsymbol{\beta} \cdot \dot{\boldsymbol{\beta}}) \hat{\mathbf{r}} \times \boldsymbol{\beta}$$

则有:

$$(\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \mathbf{F} - \boldsymbol{\beta} \cdot \mathbf{F} (\hat{\mathbf{r}} \times \boldsymbol{\beta}) = \gamma m c (\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \dot{\boldsymbol{\beta}}$$

即:

$$(\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \dot{\mathbf{v}} = \frac{1}{\gamma m} [(\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \mathbf{F} - \boldsymbol{\beta} \cdot \mathbf{F} (\hat{\mathbf{r}} \times \boldsymbol{\beta})] \quad (1)$$

故带电粒子的辐射场公式:

$$\mathbf{E} = \frac{q}{4\pi\epsilon_0 c^2 r} \frac{(\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \dot{\mathbf{v}}}{(1 - \hat{\mathbf{r}} \cdot \boldsymbol{\beta})^3}$$

用作用力可以表示为:

$$\mathbf{E} = \frac{q}{4\pi\epsilon_0 c^2 r} \left\{ \frac{\delta^3}{\gamma m} \hat{\mathbf{r}} \times [(\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \mathbf{F} - \boldsymbol{\beta} \cdot \mathbf{F} (\hat{\mathbf{r}} \times \boldsymbol{\beta})] \right\}_{\text{ret}}$$

其中 $\delta = \frac{1}{1 - \hat{\mathbf{r}} \cdot \boldsymbol{\beta}}$ 。

7.(2) 利用公式 $(\mathbf{A} \times \mathbf{B})^2 = A^2 B^2 - (\mathbf{A} \cdot \mathbf{B})^2$ 得:

$$\begin{aligned} [(\hat{\mathbf{r}} - \boldsymbol{\beta}) \times \mathbf{F}]^2 &= (\hat{\mathbf{r}} - \boldsymbol{\beta})^2 F^2 - [(\hat{\mathbf{r}} - \boldsymbol{\beta}) \cdot \mathbf{F}]^2 \\ &= (\hat{\mathbf{r}} - \boldsymbol{\beta})^2 F^2 - (\hat{\mathbf{r}} \cdot \mathbf{F} - \boldsymbol{\beta} \cdot \mathbf{F})^2 \\ &= (1 - 2\hat{\mathbf{r}} \cdot \boldsymbol{\beta} + \boldsymbol{\beta}^2) F^2 - (\hat{\mathbf{r}} \cdot \mathbf{F})^2 - (\boldsymbol{\beta} \cdot \mathbf{F})^2 + 2(\hat{\mathbf{r}} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \\ &= F^2 - 2(\hat{\mathbf{r}} \cdot \boldsymbol{\beta}) F^2 + \boldsymbol{\beta}^2 F^2 - (\hat{\mathbf{r}} \cdot \mathbf{F})^2 - (\boldsymbol{\beta} \cdot \mathbf{F})^2 + 2(\hat{\mathbf{r}} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \end{aligned} \quad (2)$$

以及:

$$\begin{aligned} [\mathbf{F} \cdot (\hat{\mathbf{r}} \times \boldsymbol{\beta})]^2 &= F^2 (\hat{\mathbf{r}} \times \boldsymbol{\beta})^2 - [\mathbf{F} \times (\hat{\mathbf{r}} \times \boldsymbol{\beta})]^2 \\ &= F^2 [r^2 \boldsymbol{\beta}^2 - (\hat{\mathbf{r}} \cdot \boldsymbol{\beta})^2] - [(\mathbf{F} \cdot \boldsymbol{\beta}) \hat{\mathbf{r}} - (\mathbf{F} \cdot \hat{\mathbf{r}}) \boldsymbol{\beta}]^2 \\ &= F^2 \boldsymbol{\beta}^2 - F^2 (\hat{\mathbf{r}} \cdot \boldsymbol{\beta})^2 - (\mathbf{F} \cdot \boldsymbol{\beta})^2 - \boldsymbol{\beta}^2 (\mathbf{F} \cdot \hat{\mathbf{r}})^2 + 2(\mathbf{F} \cdot \boldsymbol{\beta})(\mathbf{F} \cdot \hat{\mathbf{r}})(\hat{\mathbf{r}} \cdot \boldsymbol{\beta}) \\ &= \boldsymbol{\beta}^2 F^2 - (\hat{\mathbf{r}} \cdot \boldsymbol{\beta})^2 F^2 - (\boldsymbol{\beta} \cdot \mathbf{F})^2 - \boldsymbol{\beta}^2 (\hat{\mathbf{r}} \cdot \mathbf{F})^2 + 2(\hat{\mathbf{r}} \cdot \boldsymbol{\beta})(\hat{\mathbf{r}} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \end{aligned} \quad (3)$$

则 (2)、(3) 两式即为所求。

7.(3) 由 (1) 式得:

$$[\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \dot{\boldsymbol{v}}]^2 = \left\{ \frac{1}{\gamma m} \hat{r} \times [(\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F} - (\boldsymbol{\beta} \cdot \boldsymbol{F}) \hat{r} \times \boldsymbol{\beta}] \right\}^2$$

即:

$$\gamma^2 m^2 [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \dot{\boldsymbol{v}}]^2 = [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F} - (\boldsymbol{\beta} \cdot \boldsymbol{F}) \hat{r} \times (\hat{r} \times \boldsymbol{\beta})]^2 \quad (4)$$

又由 $\boldsymbol{a} \cdot \boldsymbol{b} \times \boldsymbol{c} = \boldsymbol{c} \cdot \boldsymbol{a} \times \boldsymbol{b}$ 得:

$$\begin{aligned} [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 &= \hat{r}^2 [(\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 - [\hat{r} \cdot (\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 \\ &= [(\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 - [\boldsymbol{F} \cdot \hat{r} \times (\hat{r} - \boldsymbol{\beta})]^2 \\ &= [(\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 - [\boldsymbol{F} \cdot (\hat{r} \times \hat{r} - \hat{r} \times \boldsymbol{\beta})]^2 \\ &= [(\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 - [\boldsymbol{F} \cdot (\hat{r} \times \boldsymbol{\beta})]^2 \end{aligned}$$

再代入 (2)、(3) 两式得:

$$\begin{aligned} &[\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}]^2 \\ &= [1 - 2(\hat{r} \cdot \boldsymbol{\beta}) + (\hat{r} \cdot \boldsymbol{\beta})^2] F^2 + (1 - \beta^2)(\hat{r} \cdot \boldsymbol{F})^2 + 2[1 - (\hat{r} \cdot \boldsymbol{\beta})](\hat{r} \cdot \boldsymbol{F})(\boldsymbol{\beta} \cdot \boldsymbol{F}) \\ &= \frac{F^2}{\delta^2} - \frac{1}{\gamma^2}(\hat{r} \cdot \boldsymbol{F})^2 + \frac{2}{\delta}(\hat{r} \cdot \boldsymbol{F})(\boldsymbol{\beta} \cdot \boldsymbol{F}) \end{aligned} \quad (5)$$

$$\text{其中 } \delta = \frac{1}{1 - \hat{r} \cdot \boldsymbol{\beta}}, \quad \gamma = \frac{1}{\sqrt{1 - \beta^2}}.$$

又有:

$$\begin{aligned} &[(\boldsymbol{\beta} \cdot \boldsymbol{F}) \hat{r} \times (\hat{r} \times \boldsymbol{\beta})]^2 \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 [(\hat{r} \cdot \boldsymbol{\beta}) \hat{r} - (\hat{r} \cdot \hat{r}) \boldsymbol{\beta}]^2 \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 [(\hat{r} \cdot \boldsymbol{\beta}) \hat{r} - \boldsymbol{\beta}]^2 \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 [(\hat{r} \cdot \boldsymbol{\beta})^2 \hat{r}^2 + \beta^2 - 2(\hat{r} \cdot \boldsymbol{\beta})(\hat{r} \cdot \boldsymbol{\beta})]^2 \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 [\beta^2 - (\hat{r} \cdot \boldsymbol{\beta})^2] \\ &= \beta^2 (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 - (\hat{r} \cdot \boldsymbol{\beta})^2 (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 \end{aligned} \quad (6)$$

以及:

$$\begin{aligned} &[\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}] \cdot [(\boldsymbol{\beta} \cdot \boldsymbol{F}) \hat{r} \times (\hat{r} \times \boldsymbol{\beta})] \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F}) [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \boldsymbol{F}] \cdot [\hat{r} \times (\hat{r} \times \boldsymbol{\beta})] \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F}) \left\{ (\hat{r} \cdot \boldsymbol{F})(\hat{r} - \hat{\boldsymbol{\beta}}) - [\hat{r} \cdot (\hat{r} - \boldsymbol{\beta})] \boldsymbol{F} \right\} \cdot [(\hat{r} - \boldsymbol{\beta}) \hat{r} - \boldsymbol{\beta}] \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F}) \left\{ (\hat{r} \cdot \boldsymbol{F})(\hat{r} - \hat{\boldsymbol{\beta}}) \cdot \hat{r} - [\hat{r} \cdot (\hat{r} - \boldsymbol{\beta})] \boldsymbol{F} \cdot \hat{r} - (\hat{r} \cdot \boldsymbol{\beta} - \beta^2) \hat{r} \cdot \boldsymbol{F} + [\hat{r} \cdot (\hat{r} - \boldsymbol{\beta})] \boldsymbol{\beta} \cdot \boldsymbol{F} \right\} \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F}) \left\{ [\hat{r} \cdot (\hat{r} - \boldsymbol{\beta})] \boldsymbol{\beta} \cdot \boldsymbol{F} - (\hat{r} \cdot \boldsymbol{\beta} - \beta^2) \hat{r} \cdot \boldsymbol{F} \right\} \\ &= (\boldsymbol{\beta} \cdot \boldsymbol{F}) \left\{ (1 - \hat{r} \cdot \boldsymbol{\beta}) \boldsymbol{\beta} \cdot \boldsymbol{F} - (\hat{r} \cdot \boldsymbol{\beta} - \beta^2) \hat{r} \cdot \boldsymbol{F} \right\} \\ &= \frac{1}{\delta} (\boldsymbol{\beta} \cdot \boldsymbol{F})^2 - (\hat{r} \cdot \boldsymbol{\beta} - \beta^2) (\hat{r} \cdot \boldsymbol{F}) (\boldsymbol{\beta} \cdot \boldsymbol{F}) \end{aligned}$$

注意:

$$\hat{r} \cdot \boldsymbol{\beta} - \beta^2 = (1 - \beta^2) - (1 - \hat{r} \cdot \boldsymbol{\beta}) = \frac{1}{\gamma^2} - \frac{1}{\delta}$$

则有：

$$[\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \mathbf{F}] \cdot [(\boldsymbol{\beta} \cdot \mathbf{F})\hat{r} \times (\hat{r} \times \boldsymbol{\beta})] = \frac{1}{\delta}(\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{1}{\gamma^2}(\hat{r} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) + \frac{1}{\delta}(\hat{r} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \quad (7)$$

将 (5)、(6)、(7) 式代入 (4) 式得到：

$$\begin{aligned} & \gamma^2 m^2 [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \dot{\mathbf{v}}]^2 \\ &= \frac{F^2}{\delta^2} - \frac{1}{\gamma^2}(\hat{r} \cdot \mathbf{F})^2 + \beta^2(\boldsymbol{\beta} \cdot \mathbf{F})^2 - (\hat{r} \cdot \boldsymbol{\beta})^2(\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{2}{\delta}(\boldsymbol{\beta} \cdot \mathbf{F})^2 + \frac{2}{\gamma^2}(\hat{r} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \\ &= \frac{F^2}{\delta^2} - \left[(\hat{r} \cdot \boldsymbol{\beta})^2 - \beta^2 + \frac{2}{\delta} \right] (\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{1}{\gamma^2}(\hat{r} \cdot \mathbf{F})^2 + \frac{2}{\gamma^2}(\hat{r} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \end{aligned}$$

因为：

$$\begin{aligned} (\hat{r} \cdot \boldsymbol{\beta})^2 - \beta^2 + \frac{2}{\delta} &= (\hat{r} \cdot \boldsymbol{\beta})^2 - \beta^2 + 2 - 2(\hat{r} \cdot \boldsymbol{\beta}) \\ &= 1 - 2(\hat{r} \cdot \boldsymbol{\beta}) + (\hat{r} \cdot \boldsymbol{\beta})^2 + 1 - \beta^2 \\ &= [1 - (\hat{r} \cdot \boldsymbol{\beta})]^2 + (1 - \beta^2) \\ &= \frac{1}{\delta^2} + \frac{1}{\gamma^2} \end{aligned}$$

则有：

$$\begin{aligned} \gamma^2 m^2 [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \dot{\mathbf{v}}]^2 &= \frac{F^2}{\delta^2} - \left(\frac{1}{\delta^2} + \frac{1}{\gamma^2} \right) (\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{1}{\gamma^2}(\hat{r} \cdot \mathbf{F})^2 + \frac{2}{\gamma^2}(\hat{r} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F}) \\ &= \frac{F^2}{\delta^2} - \frac{1}{\delta^2}(\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{1}{\gamma^2} [(\hat{r} \cdot \mathbf{F})^2 + (\boldsymbol{\beta} \cdot \mathbf{F})^2 - 2(\hat{r} \cdot \mathbf{F})(\boldsymbol{\beta} \cdot \mathbf{F})] \\ &= \frac{F^2}{\delta^2} - \frac{1}{\delta^2}(\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{1}{\gamma^2}(\hat{r} \cdot \mathbf{F} - \boldsymbol{\beta} \cdot \mathbf{F})^2 \end{aligned}$$

故带电粒子辐射功率的角分布公式：

$$\frac{dP}{d\Omega} = \frac{q^2}{16\pi^2\epsilon_0 c^3} \frac{[\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \dot{\mathbf{v}}]^2}{(1 - \boldsymbol{\beta} \cdot \hat{r})^5} = \frac{q^2}{16\pi^2\epsilon_0 c^3} \cdot \delta^5 [\hat{r} \times (\hat{r} - \boldsymbol{\beta}) \times \dot{\mathbf{v}}]^2$$

用作用力可以表示为：

$$\frac{dP}{d\Omega} = \frac{q^2}{16\pi^2\epsilon_0 c^3} \cdot \frac{\delta^3}{\gamma^2 m^2} \left[F^2 - (\boldsymbol{\beta} \cdot \mathbf{F})^2 - \frac{\delta^2}{\gamma^2}(\hat{r} \cdot \mathbf{F} - \boldsymbol{\beta} \cdot \mathbf{F})^2 \right]$$

其中 $\delta = \frac{1}{1 - \hat{r} \cdot \boldsymbol{\beta}}$ 。

9.(1) 粒子受到的 Lorentz 力提供加速度：

$$q\mathbf{v} \times \mathbf{B} = \frac{d\mathbf{p}}{dt} \quad (1)$$

即：（此时 $\mathbf{v}$ 大小不变，则 γ 为常数）

$$q\boldsymbol{\beta} \times \mathbf{B} = \gamma m \dot{\boldsymbol{\beta}} \quad (2)$$

相对论性带电粒子辐射总功率用 Liénard 公式描述：

$$P = \frac{q^2}{6\pi\epsilon_0 c} \gamma^6 [\dot{\boldsymbol{\beta}}^2 - (\boldsymbol{\beta} \times \dot{\boldsymbol{\beta}})^2]$$

此时粒子做圆周运动， $\boldsymbol{\beta} \perp \dot{\boldsymbol{\beta}}$ ，则有：

$$\dot{\beta}^2 - (\boldsymbol{\beta} \times \dot{\boldsymbol{\beta}})^2 = \dot{\beta}^2 - (\beta \dot{\beta})^2 = (1 - \beta^2)\dot{\beta}^2 = \frac{\dot{\beta}^2}{\gamma^2}$$

于是得到带电粒子的辐射功率：

$$P = \frac{q^2 \gamma^2}{6\pi\epsilon_0 m^2 c^3} \left(\frac{d\mathbf{p}}{dt} \right)^2 = \frac{q^2}{6\pi\epsilon_0 c} \gamma^4 \dot{\beta}^2$$

代入 (1) 或 (2) 式即得：（注意 $\beta^2 = \frac{\gamma^2 - 1}{\gamma^2}$ ）

$$P = \frac{q^4 B^2 (\gamma^2 - 1)}{6\pi\epsilon_0 m^2 c}$$

9.(2) 粒子的能量为 $E = \gamma mc^2$ ，而其能量减少来自于辐射：

$$\frac{dE}{dt} = -\frac{q^4 B^2 (\gamma^2 - 1)}{6\pi\epsilon_0 m^2 c} = -\frac{q^4 B^2}{6\pi\epsilon_0 m^2 c} \left(\frac{E^2}{m^2 c^4} - 1 \right)$$

即：

$$\frac{dE}{(E^2/m^2 c^4) - 1} = -\frac{q^4 B^2}{6\pi\epsilon_0 m^2 c} dt$$

由积分公式：

$$\int \frac{dy}{y^2 - 1} = \int \frac{1}{2} \left(\frac{1}{y+1} + \frac{1}{y-1} \right) dy = \frac{1}{2} \ln \left| \frac{1+y}{1-y} \right|$$

以及初始条件 $t = t_0$ 时 $E_0 = \gamma_0 mc^2$ ，解得：

$$E(t) = mc^2 \cdot \frac{\gamma_0 + 1 + (\gamma_0 - 1)e^{-\eta(t-t_0)}}{\gamma_0 + 1 - (\gamma_0 - 1)e^{-\eta(t-t_0)}}, \quad \eta = \frac{q^4 B^2}{3\pi\epsilon_0 m^3 c^3}$$

9.(3) 在非相对论条件下，电子辐射的功率退化为 Larmor 公式：

$$P = \frac{e^2 \dot{\mathbf{v}}^2}{6\pi\epsilon_0 c^3}$$

而 Lorentz 力的公式为：

$$q\mathbf{v} \times \mathbf{B} = m\dot{\mathbf{v}}$$

由题意 $\mathbf{v} \perp \mathbf{B}$ ，于是有：

$$P = \frac{e^2}{6\pi\epsilon_0 c^3} \left(\frac{qvB}{m} \right)^2 = \frac{q^4 v^2 B^2}{6\pi\epsilon_0 m^2 c^3}$$

在非相对论条件下，动能 $T = \frac{1}{2}mv^2$ ，则：

$$\frac{dT}{dt} = -\frac{q^4 v^2 B^2}{6\pi\epsilon_0 m^2 c^3} = -\frac{q^4 B^2 T}{3\pi\epsilon_0 m^3 c^3}$$

即：

$$\frac{dT}{T} = -\frac{q^4 v^2 B^2}{6\pi\epsilon_0 m^2 c^3} = -\frac{q^4 B^2}{3\pi\epsilon_0 m^3 c^3} dt$$

由初始条件 $t = t_0$ 时 $T = T_0$ ，解得：

$$T = T_0 e^{-\eta(t-t_0)}, \quad \eta = \frac{q^4 B^2}{3\pi\epsilon_0 m^3 c^3}$$

补充题

2. 粒子受到的 Lorentz 力提供圆周运动的向心力:

$$e\mathbf{v} \times \mathbf{B} = -\frac{mv^2}{r}\hat{r}$$

在相对论条件下:

$$m = \gamma m_0, \quad \mathbf{p} = \gamma m_0 \mathbf{v}$$

于是有:

$$\frac{epB}{\gamma m_0} = \frac{\gamma m_0}{r} \left(\frac{p}{\gamma m_0} \right)^2 = \frac{p^2}{\gamma m_0 r}$$

解得轨道半径为:

$$r = \frac{p}{eB}$$

说明非相对论条件下的轨道半径公式 $r = \frac{p}{eB}$ 可以推广到相对论条件, 但此处 $p = mv = \gamma m_0 v$ 为相对论条件下的动量。

辐射总功率为:

$$P = \frac{q^2 \gamma^2}{6\pi\epsilon_0 m^2 c^3} \left(\frac{d\mathbf{p}}{dt} \right)^2 = \frac{q^2 \gamma^2}{6\pi\epsilon_0 m^2 c^3} \left(\frac{epB}{\gamma m_0} \right)^2 = \frac{e^4 p^2 B^2}{6\pi\epsilon_0 m^4 c^3}$$

3. 电子的静能为 $m_0 c^2 = 0.511 \text{ MeV}$, 加速到 10 MeV 时:

$$\gamma = \frac{E}{m_0 c^2} = \frac{10 \text{ MeV}}{0.511 \text{ MeV}} = 19.5695$$

$$\beta = \sqrt{\frac{\gamma^2 - 1}{\gamma^2}} = 0.9987$$

在非相对论条件下, 电子的辐射功率为:

$$P_{\text{nr}} = \frac{\dot{\beta}^2}{6\pi\epsilon_0 c}$$

当 $\dot{\mathbf{v}} \parallel \mathbf{v}$ 时:

$$P = \frac{\gamma^6 \dot{\beta}^2}{6\pi\epsilon_0 c} = \gamma^6 P_{\text{nr}}$$

则有:

$$\frac{P}{P_{\text{nr}}} = \gamma^6 = 5.6167 \times 10^7$$

当 $\dot{\mathbf{v}} \perp \mathbf{v}$ 时:

$$P = \frac{\gamma^4 \dot{\beta}^2}{6\pi\epsilon_0 c} = \gamma^4 P_{\text{nr}}$$

则有:

$$\frac{P}{P_{\text{nr}}} = \gamma^4 = 1.4666 \times 10^5$$
